- ▶ True Configuration
- ▶ os]: Red Hat Linux 7

REDRAW: this slide's diagram was built from 3 PowerPoint shapes, which carry no image to extract.

## Stackelberg security games have been used to model the strategic interaction between defender and attacker

- ▶ Cyber Deception Game ( Schlenker et al. 2018) models the defender's choice of deceptive network configurations and the attacker's reconnaissance as a zero-sum game.
- ▶ Cyber Camouflage Games (Thakoor et al. 2019) extends the model to general-sum to capture the uncertainty about attacker's payoff.
- ▶ Attack Graph Deception Game (Milani et al. 2020) models the sequential actions of the attacker as a path on the attack graph.

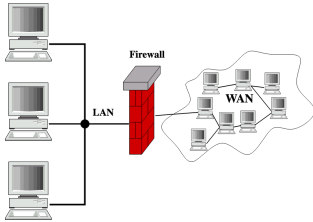

## Stackelberg security games have been used to model the strategic interaction between defender and attacker

- ▶ The defender and attacker's ability to adapt to real-time observations is under explored

Stackelberg security games have been used to model the strategic interaction between defender and attacker (cont.)

# Attackers can gather more information about the network overtime

# Defenders are also getting alerts in real time

## Alerts

# We propose an Adaptive Cyber Deception Game

- ▶ Observe
- ▶ Update defense strategy
- ▶ Surveillance
- ▶ Update attack strategy

# We build our game model on an attack graph that can be interpreted at various granularity

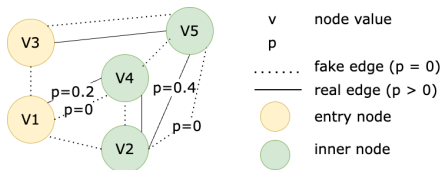

## ► probability of success

## Defenders can take two types of action: deceptive and protective actions

- ▶ Deceptive
  - ▶ Hide a real edge
  - ▶ Add a fake edge
  - ▶ Modify the perceived values of a set of nodes
- ▶ Protective

# Defenders can take two types of action: deceptive and protective actions (cont.)

## Each abstract action on the attack graph can be translated to multiple deceptive capabilities

- ▶ Hide real edge
- ▶ Add fake edge
- ▶ Change node value
- ▶ Fake foothold
- ▶ Fake privilege escalation

REDRAW: this slide's diagram was built from 5 PowerPoint shapes, which carry no image to extract.

# We assume two types of adversary: Powerful and Naive

- ▶ Powerful
- ▶ Naive

## We study the use of a reinforcement learning algorithm Proximal Policy Optimization (PPO) with self-play

- ▶ Input:
- ▶ Self location
- ▶ Perceived node values
- ▶ Real edge visibility
- ▶ Fake edge visibility

$$\pi_a(s) = a_a$$

## We study the use of a reinforcement learning algorithm Proximal Policy Optimization (PPO) with self-play

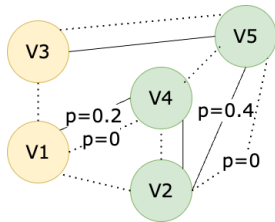

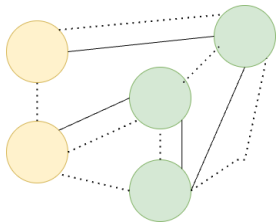

- ▶ Input:
- ▶ Attacker's location,
- ▶ Perceived node values,
- ▶ Real edge visibility,
- ▶ Fake edge visibility

$$\pi_d(s) = a_d$$

# Reinforcement learning with self-play

- ▶ Attacker's
- ▶ Neural Network Policy
- ▶ Defender's
- ▶ 1. Collect experiences based on the player's current policies
- ▶ 2. Run one-step update for the defender/attacker's network parameters separately

## Reinforcement learning with self-play (cont.)

$$\pi_a(s) = a_a$$

## We compared the PPO defender with a heuristic defender

### ► Powerful/Naive)

| Training Phase |          | Evaluation Phase        |                         |
|----------------|----------|-------------------------|-------------------------|
| Defender       | Attacker | Attacker                | Defender                |
| PPO            | PPO      | PPO (PPO-trained)       | PPO (trained) Heuristic |
| Heuristic      | PPO      | PPO (Heuristic-trained) |                         |
|                |          | Heuristic               |                         |

## We compared the PPO defender with a heuristic defender (cont.)

REDRAW: this slide's diagram was built from 4 PowerPoint shapes, which carry no image to extract.

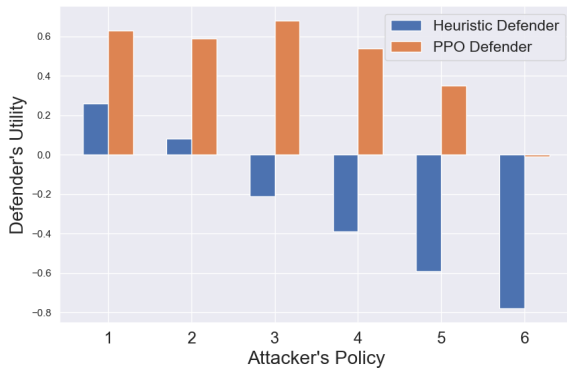

# The PPO Defender always outperforms the heuristic defender.

---

- ▶ Naive
- ▶ Powerful

# The PPO Defender always outperforms the heuristic defender.

(cont.)

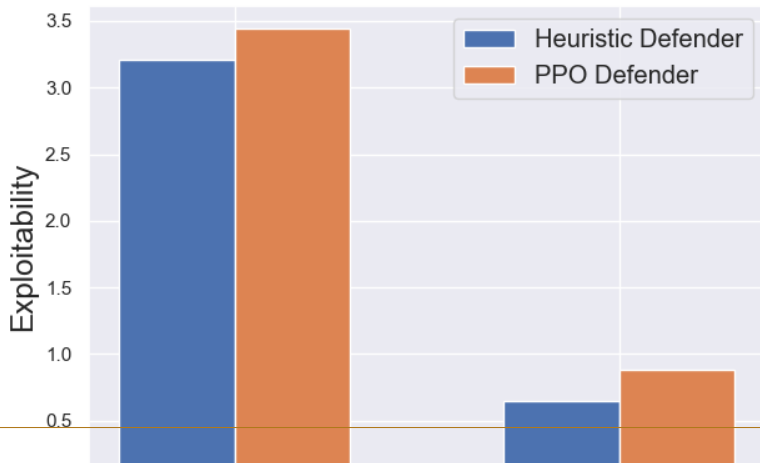

# We measure exploitability to see if the training reached nash equilibrium

- ▶ Exploitability of
- ▶ Exploitability of attacker's policy
- ▶ Exploitability of defender's policy

$$\text{Exp}(\pi_a, \pi_d) = \text{Exp}_a(\pi_a, \pi_d) + \text{Exp}_d(\pi_a, \pi_d) \quad \text{Exp}_a(\pi_a, \pi_d) = U_a(\pi_a, \pi_d) - U_a(\pi_a, \text{BR}_d(\pi_a)) \quad \text{Exp}_d(\pi_a, \pi_d) = U_d(\pi_a, \pi_d) - U_d(\text{BR}_a(\pi_d), \pi_d)$$

# The (PPO defender, PPO attacker) pair of policies is closer to a Nash equilibrium

# What now? With the promising performance in simulation, we went on deploying RL-based defense strategy in real-world network

rapid7/metasploit-framework

## #18621 Add module 1 Backup Migration W plugin (CVE-2023-...

# Cognitive partner had the highest performance than alternatives

- ▶ Cognitive Agent
- ▶ Team loss
- ▶ Avg. loss
- ▶ Episode

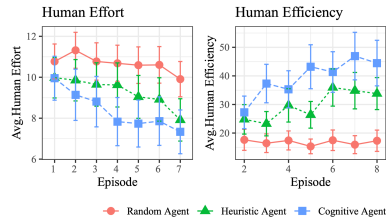

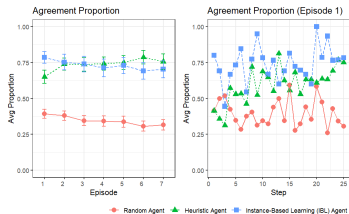

Team Loss Comparison

- IBL teammate agent had the highest performance across alternatives.
- IBL team loss somewhat decreased over time, heuristic somewhat increased.

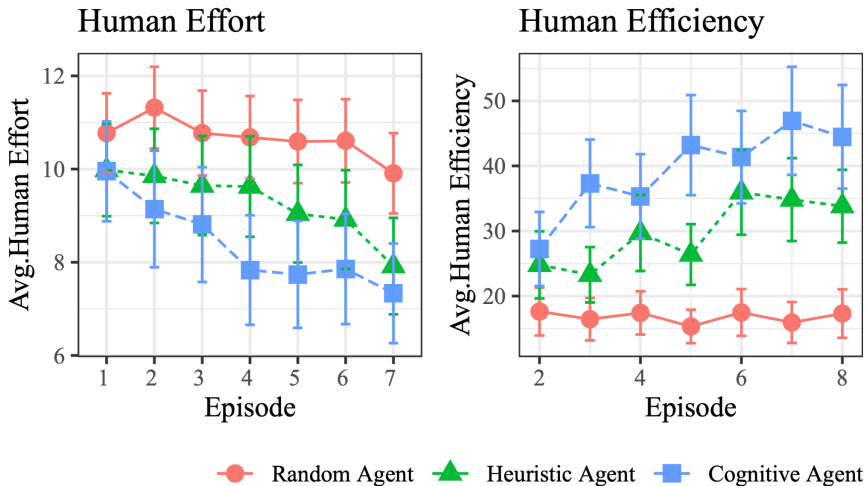

# Humans quickly learn to trust competent agents

- ▶ Cognitive Agent
- ▶ Agreement Proportion
- ▶ Avg. Proportion
- ▶ Episode

# Humans working with cognitive agents achieve more while doing less

## Perception of agents is affected by high expectations, which later led to blind trust or great disappointment

- ▶ It was challenging because you had to work with an AI that can not communicate. Made it difficult to come up with a plan or strategize. ”
- ▶ I trusted the partner more than I trusted myself. I was glad it was AI, I assumed they were using an algorithm to make the decisions.”

## What now? Cyber defense requires coordinated, multi-step strategies

- ▶ Strategic collaboration is crucial
- ▶ A deeper understanding of task dynamics is needed

# Teamwork

- ▶ Coordination
- ▶ Communication
- ▶ Disruption & Recovery
- ▶ In our ongoing work, we expand TDG platform to enable automated generation of team tasks and supports experiments with real agents.
- ▶ Team Task Generator

| I did uh cigarette lighter"                                                     | Blue  |
| For one"                                                                        | Blue  |
| Mm okay I did knife"                                                            | Pink  |
| Knife"                                                                          | Green |
| Okay well do knife then"                                                        | Blue  |
| Yeah yeah makes sense"                                                          | Blue  |
| Well I think it that and and um the cigarette lighter are all pretty important" | Pink  |
| So I would say cigarette lighter is two"                                        | Pink  |
| I didn't write that down but I kinda made a connection afterwards"              | Pink  |
| 67 Yeah okay"                                                                   | Blue  |

## we utilized the O613 version of GPT-4-32k

- ▶ speaker id, text)
- ▶ Update ranking based on new information
- ▶ Decide whether to grab the conversation floor
- ▶ Generate natural language to express its opinion
- ▶ Can LLM agents do better? We designed a large language model based agent for this task

we utilized the O613 version of GPT-4-32k (cont.)

# We proposed an algorithm to enable free-form conversation in groups of LLM agents

- ▶ Start
- ▶ Wait for an agent to Grab the floor and become the speaker
- ▶ Is the conversation floor free?
- ▶ Is the discussion finished?
- ▶ The most eager preemptor become the next speaker
- ▶ Is anyone Claiming the floor ?

REDRAW: this slide's diagram was built from 20 PowerPoint shapes, which carry no image to extract.

# Capturing How Humans Communicate and Feel

---

- ▶ Dialogue Acts
- ▶ Proposal
- ▶ Agreement
- ▶ Disagreement
- ▶ Confirmation

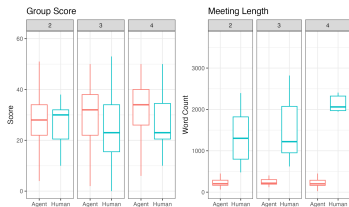

# Metrics

---

- ▶ Performance Metrics
  - ▶ Group Score — distance from expert ranking
  - ▶ Meeting Length — total word count or time
- ▶ Affective Metrics
  - ▶ Positivity / Negativity — based on sentiment annotations

# Agent groups achieved higher scores in shorter time frames

- ▶ Group Score
- ▶ Meeting Length
- ▶ Score
- ▶ Word Count

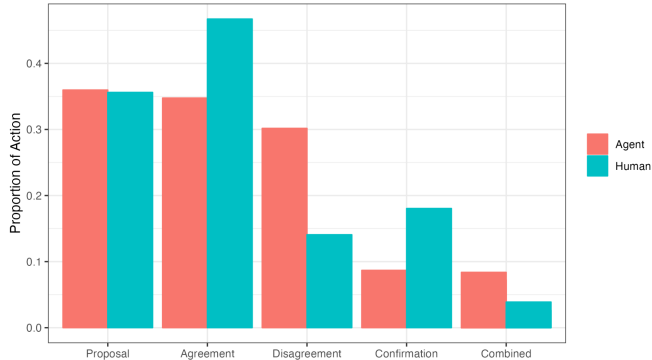

Agent  
Human

Agent discussions reveal greater disagreement among agents within a group compared to human groups.

- ▶ Agent
- ▶ Human
- ▶ Proposal
- ▶ Agreement
- ▶ Disagreement

# Agent discussions reveal greater disagreement among agents within a group compared to human groups. (cont.)

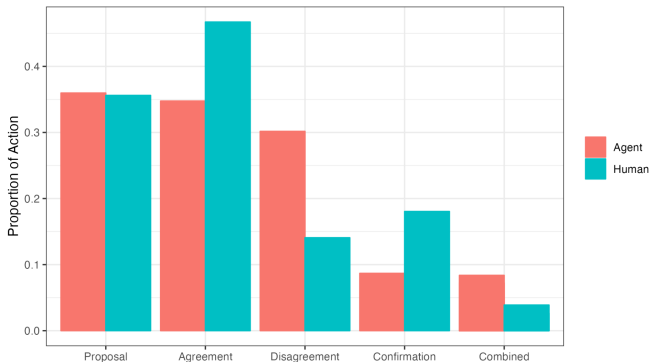

Agent groups also tend to produce more complex statements that contain both agreements and disagreements.

- ▶ Agent
- ▶ Human
- ▶ Proposal
- ▶ Agreement
- ▶ Disagreement

Agent groups also tend to produce more complex statements that contain both agreements and disagreements. (cont.)

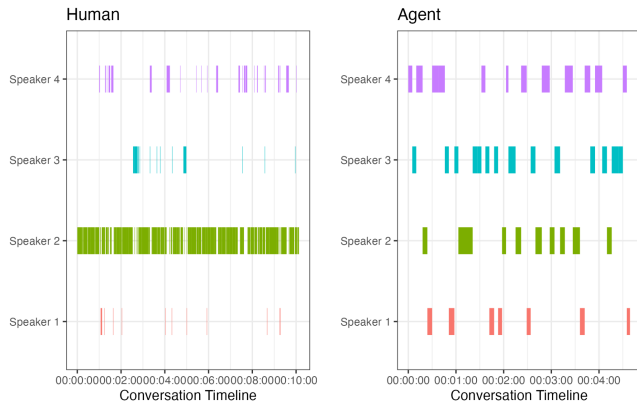

## Agents participated in the discussion more equally than humans

---

- Speaker 1
- Speaker 2
- Speaker 3
- Speaker 4
- Agent

# Agents participated in the discussion more equally than humans

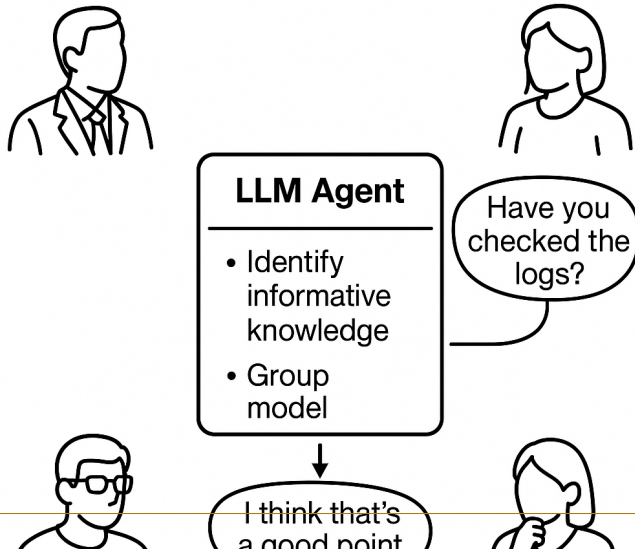

(cont.)

# Moving Forward: LLM Agent -assisted group problem solving – Detecting Knowledge Gap & Group Dynamics

- ▶ Identify knowledge gap
- ▶ Model the group dynamic

# Moving Forward: LLM Agent -assisted group problem solving – Detecting Knowledge Gap & Group Dynamics (cont.)
